
MIMRIES

The wedding memory platform built for a real wedding
— then rebuilt for everyone.

DOMAIN	mimries.com manage.mimries.com

"The candid moments captured by 400 other people are gone, sitting on phones that will be replaced or cleared within a year."

The Problem

Indian weddings average 400-600 guests. Most of them carry smartphones with 48 hours of photos they will never share.

The existing options are all friction-heavy. Google Photos shared albums require knowing the link and a Google account. WhatsApp groups require being added by someone who remembers to do it. Wedding-specific gallery apps exist in the Western market but are built for different cultural contexts and different scale expectations.

The result: the couple ends up with photos from the official photographer and maybe a few dozen from close family. The candid moments captured by 400 other people - the uncle who caught the exact right second, the childhood friend's video of the dance floor - are gone. Sitting on phones that will be replaced or cleared within a year.

The friction is especially real for elderly guests. Typing a URL, creating an account, and finding an upload button is a multi-step process that gets abandoned. Sending a photo to Telegram is not.

"The lowest possible friction for a 70-year-old at a venue with spotty WiFi: scan this QR code, then send your photo to this Telegram chat."

Mimries starts from that observation. Everything else is built around making that work.

The Product

Mimries is a SaaS platform for event organisers. An organiser signs up, enters event details through a guided setup flow, and immediately gets a live guest web app - no design work, no developer required.

What guests experience

- Scan one QR code at the venue

- Open the guest app ([mimries.com/\[event-slug\]](https://mimries.com/[event-slug])) - no app download, no account creation

- See the event story, schedule with live countdowns, venue details, and the photo gallery

- Upload photos via Telegram, WhatsApp (coming soon), or direct upload on the web app

- Bilingual support - English and any second language authored during setup

What the organiser manages

- Dashboard at manage.mimries.com - all submitted photos in a pending review queue

- One-click approve or reject - approved photos go live in the guest gallery instantly

- Guest list management with per-guest upload permissions

Event management: any event name, date, venue, and description

Settings with a live mobile simulator - changes preview in real time in a phone frame

Comparison

Feature	Mimries	Google Photos	WhatsApp Group	Western Apps
No account for guests	Yes	No	No	No
Works for elderly	Yes	No	Partially	No
Hindi / bilingual	Yes	No	N/A	No
Admin review queue	Yes	No	No	Some
Custom domain	Paid tier	No	N/A	Some
Indian scale 400-600	Yes	Technically	Yes	No

Pricing tiers

Tier	Price	Key features
FREE	Free forever	mimries.com/[slug] 5 GB "Made with Mimries" watermark
SHAGUN	Rs.1,999 one-time	Remove watermark custom domain (manual attach)
BARAAT	Rs.4,999 one-time	Custom domain auto-buy + DNS AI theme customiser 100 GB
BESPOKE	Custom quote	White-glove setup dedicated support

No ads on any tier. Ever.

Key Technical Decisions

Decision 1 – Telegram first, WhatsApp actively in progress

The original upload path was direct web upload only. WhatsApp was the obvious extension - every Indian family already uses it. WhatsApp integration was attempted first. Facebook's developer programme requires business verification, a registered phone number, and a review process that takes weeks. The wedding was in April 2026. There was no path to production WhatsApp integration in time.

The pivot to Telegram happened in a single weekend. Telegram's Bot API has no approval gate, handles large file uploads natively, and the inline keyboard feature solved a problem that had not been fully considered: with multiple events on multiple days, how does the bot know which event a photo belongs to? The inline keyboard asks "which event?" and receives a structured answer - one tap, no typing. The session persists for 24 hours; after inactivity, the bot asks again.

WhatsApp integration is now the active next milestone. Target: production in under two months.

The implementation uses the WhatsApp Business Cloud API - Meta's cloud-hosted version with no dedicated hardware requirement and faster onboarding than the older On-Premises API. The plan:

- A Meta-approved message template for photo-collection use cases

- A webhook endpoint in the existing Cloudflare Worker receiving WhatsApp messages and routing photos to the same R2 pending bucket the Telegram path uses

- The same admin review queue - no new UI needed, just a new source channel

When live, guests will have three upload paths: Telegram (current), WhatsApp (in progress), and direct web upload. Telegram remains the primary recommendation for large Indian weddings - it has a live track record now.

Decision 2 – The Cloudflare stack

Four reasons, each concrete:

Zero egress fees (R2).

On AWS S3, egress is charged per GB out. On Cloudflare R2, egress is free. For a photo-heavy app with no control over simultaneous gallery loads, this is the difference between a predictable cost model and a bill spike on the event day.

No cold starts (Workers).

AWS Lambda cold starts take 1-3 seconds. Cloudflare Workers run on V8 isolates: sub-millisecond cold starts. Guests on congested venue WiFi cannot tolerate infrastructure-introduced latency.

Edge-located SQLite (D1).

The guest app is read-heavy. D1 distributes SQLite read replicas near the user. Guests in India load from a nearby edge node, not a US-east data centre.

Solo founder unit economics.

Cloudflare Workers Paid: \$5/month for 10 million requests per day. AWS equivalent is genuinely difficult to forecast. Predictability matters as much as price level for a bootstrapped product.

Decision 3 – Vanilla JS guest app, Next.js admin portal

The guest app loads on hundreds of low-end Android phones on shared venue WiFi. A React bundle adds parse and execution overhead that vanilla JS does not. The guest app boots in one network round-trip. The admin portal is used by one person on a real computer, once. It can afford Next.js ergonomics. These are not the same use case and should not share a runtime.

The Build Story

Origin

Vinamra Pandey (Vinny) is a solo founder. In early 2026 he was planning his sister's wedding - Apoorva and Saumya, Lucknow, April 23-27, 2026, approximately 500 guests - and had no good answer to the question: "how do we get photos from everyone?"

He started building on February 12, 2026. Initial scope was narrow: a web page where guests could upload photos. No accounts, no app download. The first working version was ready by late March: a bespoke, single-wedding application, built for that one couple.

The Original Wedding App — What Guests Saw

Every screen below is the actual live app Apoorva and Saumya's 500 guests were given access to in April 2026. The design, the couple's names, the event dates, and the wedding theme were all specific to this one wedding.

SCREEN 1 — LANGUAGE SELECT

First screen after QR scan: language selection (English / Hindi). The couple's monogram (A * S) is personalised.

SCREEN 2 — PHONE ENTRY

"You're Invited" — enter a +91 phone number to continue. No password, no account creation.

SCREEN 3 — THE COUPLE'S STORY

The couple's portmanteau name displayed as a dictionary entry, bilingual. Shown as a full-bleed story slide before events.

SCREEN 4 — DIGITAL INVITATION

Formal invitation slide with both families listed in English and Hindi, dates and location.

SCREEN 5 — HERO PHOTO

The final story slide: the couple's own photograph with a "Let's Begin" CTA — transition from the story into the live event app.

SCREEN 6 — EVENTS HUB

The events overview: Engagement, Haldi Mehendi & Sangeet, and Wedding — each with a live countdown. Tapping a card opens the full event detail page.

EVENT DETAIL PAGES — ENGAGEMENT / HALDI & SANGEET / WEDDING

Each event has its own full detail page: a live countdown, a downloadable PDF invitation, venue details, and the photo upload section. Venue names and addresses are blurred below for privacy.

Engagement event detail page — invitation card, venue (blurred), and Share Your Memories section.

Second event detail — same layout, different venue (blurred).

Main wedding event detail — invitation card personalised to the ceremony venue (blurred).

At the bottom of every event detail page: two upload paths side by side. "Share Your Photos" opens the Telegram bot pre-set to this event. "Upload Photos Directly" is the browser-based upload. Both feed the same pending review queue in the admin dashboard.

First Deployment — April 2026

The wedding ran across five days in Lucknow: Engagement on April 23, Haldi Mehendi & Sangeet on April 25, and the main Wedding on April 27. Approximately 250 of the 500 guests used the platform across those days.

The platform worked.

The Redesigned Platform — Mimries

After the wedding, the bespoke app was rebuilt from scratch as a proper multi-tenant SaaS. The new design is cleaner, the admin interface is fully built out, and the guest app is now served at [mimries.com/\[slug\]](https://mimries.com/[slug]) for any couple who signs up - not just one. The same design system will be the foundation for every event type and every future theme.

The redesigned guest app events screen — cleaner cards, refined typography. This design system is the template for all upcoming event themes.

Inline keyboard event picker inside Telegram. Guest scans QR, bot immediately asks which event. One tap to confirm.

The admin workspace overview — stats cards, quick access to photo review queue, guest list, gallery.

All submitted photos in a single queue. Approve or reject with one click; approved photos appear in the guest gallery instantly.

Step 2 of 5 40%

What are your names?
This will appear in your guest app.

BRIDE'S NAME

Changes to the guest app preview in real time inside a rendered phone frame on the right. No guessing what it will look like.

What the SaaS Rebuild Added

Multi-workspace architecture — each organiser gets their own isolated workspace

6-step onboarding wizard with confetti on completion

Admin dashboard: photo review queue, guest management, gallery management

Telegram bot: session management, inline event picker, R2 upload pipeline

Hindi transliteration — local pass + async Google Input Tools API refinement

Live mobile simulator in settings

Pricing tier structure (FREE / SHAGUN / BARAAT / BESPOKE)

Brand renamed to Mimries

TIMELINE

Date	Milestone	Status
Feb 12, 2026	First line of code	Done

Date	Milestone	Status
Late Mar 2026	Working bespoke app — Apoorva & Saumya’s wedding	Done
Apr 23-27, 2026	First live wedding — ~250 of 500 guests used it	Done
May 2026	SaaS rebuild begins — multi-tenant architecture	Done
May-Jun 2026	Dashboard, Telegram bot, Hindi support, onboarding wizard	Done
Jul 2026	Active development — polish, this case study	Done
~2 months	WhatsApp upload support in production	Next
Upcoming	Payment integration, custom domain automation, new themes	Next

REAL NUMBERS

Metric	Value
First line of code	February 12, 2026
Source files (excl. dependencies)	~90
Tech layers	3 (Next.js admin / Hono Worker API / Vanilla JS guest app)
Cloudflare services in production	4 (Pages, Workers, D1, R2)
D1 tables	6 (workspaces, guests, submissions, events, access_logs, telegram_sessions)
Guests served — first wedding	~250 of 500
Weddings on platform	2 confirmed + 4+ upcoming
Contributors	1 (solo founder)

The Vision – Every Event, Every Style

The events table in D1 is schema-agnostic. An "event" is a row with an event_key, a name, a date, a venue, and a display_order. "Haldi" and "Sangeet" are content, not hardcoded categories. The platform does not care what you call your event.

This opens a direct expansion path: the same infrastructure that served Apoorva and Saumya's five-day wedding can serve a concert, a birthday party, a corporate retreat, or a college fest. The core loop stays identical - organiser sets up, guests scan and upload, organiser reviews, approved photos go live. The visual language changes; the simplicity does not.

Premade Design Themes per Event Category

The current build has one design: the warm ivory-and-gold Indian wedding theme seen in the original app. The next stage introduces a library of complete, professionally designed themes per event category. The organiser picks a theme from a gallery, fills in the event details, and gets a live URL. No design tools, no font pickers, no colour wheels — each theme is a complete system. The organiser's only job is to provide the content.

PLANNED EVENT CATEGORIES AND DESIGN THEMES

Event category	Planned design themes
Indian Wedding	Traditional Ivory (live now) Modern Minimal Royal Deep Red Pastel Garden Old Delhi Vintage
Destination Wedding	Beach Luxe Mountain Rustic Tropical Bloom European Cathedral Bohemian
Concert / Gig	Neon Dark Vintage Poster Minimal Stage Film Grain Rave
Birthday Party	Elegant Gold Pastel Celebration Garden Party Retro Disco
Corporate Event	Clean Professional Tech Dark Bold Brand Magazine Brutalist
College Fest	Bold Graphic Neon Campus Zine Y2K Revival Sports Day
Cultural Festival	Festive Diwali Navratri Holi Splash Eid Gold Christmas

What stays the same across every theme and every event type

- QR code entry — no app download, no account creation for guests
- Bilingual support — any two languages the organiser chooses
- Telegram + WhatsApp + direct upload paths for photo submission
- Admin review queue before any photo is visible to other guests
- Edge infrastructure — Cloudflare Workers + D1 + R2 — with no egress fees
- "Made with Mimries" branding on free tier, removable on paid

The AI Collaboration Account

This project was built with significant AI assistance. The nature of the collaboration is more specific than "AI wrote the code."

Ideation and product decisions: human

Every product decision came from Vinny's direct experience planning a real wedding. The choice to build for Indian weddings, the realization that elderly guests need a lower-friction upload path, the Telegram pivot as a timing call (not permanent), the pricing structure, the vanilla JS decision — none came from an AI suggestion.

Implementation: Google Antigravity + Claude Code

Google Antigravity (a Gemini-powered IDE) was the primary tool during the initial build phase. It produced the first working bespoke wedding app — the one Apoorva and Saumya's guests used in April.

Claude Code (Anthropic's CLI coding assistant) drove the SaaS rebuild: writing code from specification, debugging, and reasoning about edge cases. The Telegram bot's session management, event picker, and R2 upload pipeline went from concept to working code in a single weekend.

What the collaboration looked like

Vinny maintained a CLAUDE.md file — a single source of truth for the project: exact tech stack, D1 schema, rename tables, commit sequence, and rules that could not be overridden. Quality of AI output was directly proportional to the quality of that specification.

The AI excelled at:

- Implementing a well-defined spec precisely
- Finding the right CSS property to fix a layout bug
- Writing boilerplate — route handlers, TypeScript types, D1 query patterns
- Reasoning about edge cases given full context

The AI did not:

- Decide which feature to build next
- Judge whether a UX felt right for a 70-year-old Indian grandmother
- Determine which architectural trade-offs mattered for the actual use case
- Override any decision Vinny had made about the product direction

"A solo founder building a production SaaS in five months — from a blank file on February 12 to a live platform serving 250 guests at a real wedding in April, then into a full multi-tenant rebuild — would not have been possible at this speed without AI-assisted coding. The output is Vinny's product. The implementation velocity came from the tooling."

What's Next

Confirmed planned items — not invented roadmap filler.

Feature	Detail	ETA
WhatsApp upload	Business Cloud API — same R2 + review pipeline as Telegram	~2 months
Privacy Policy + Terms	Required for Google OAuth production approval	Next
Custom error pages	not-found + error with Mimries branding	Next
Full mobile audit 375px	Systematic pass across all admin pages	Next
Payment integration	SHAGUN and BARAAT tier purchases — no payment flow yet	Soon
Custom domain automation	DNS auto-provisioning for BARAAT tier (currently manual)	Soon
Design theme library	Premade themes per event category — concerts, birthdays, etc	Later
Non-wedding event launch	Concert and birthday party categories go live	Later
Broader launch	Beyond family-and-friends to organisers who don't know Vinny	Later

Positioning Quick Reference

Raw material to pick from — not final copy.

ONE-LINERS

- "Your event's photos, from every guest, in one place."
- "Built for the uncle with the best seat and the worst tech skills."
- "The memory album that fills itself."
- "One QR, 500 guests, every moment."

30-SECOND ELEVATOR PITCH

Mimries gives event organisers a live guest web app — instantly, with no design work. Guests scan a QR code and send photos via Telegram, WhatsApp (coming soon), or direct upload. The organiser reviews and approves before photos appear in the shared gallery. Started with Indian weddings. Expanding to concerts, birthdays, corporate events, and every event category — each with its own curated design theme library. Free to start.
